

## Progress made thus far

I am currently researching how to create extensions on various browsers. I think I have determined that Google Chrome will be the most user friendly for setting up our given extension for our peer review testers. I have set up a skeleton for the project that I will soon begin development on.

## Remaining Tasks

I need to develop the frontend components of the browser extension, as well as implement the BM25 calculations in the code.

## Issues/Challenges

I am fairly new to frontend development, so learning how to setup a project and combine html, js, and css has been a little confusing for me.
